

Create a data frame with student names, marks, and grades. Perform subsetting to display students scoring above 75. Install and load the ggplot2 package. Create a simple scatter plot using the created data frame.

Read the Airline Delays dataset file into R and display its structure and summary. Given a dataset, compute mean, median, and mode.

Read the E-commerce dataset file into R and display its structure and summary. Calculate standard deviation, variance, and coefficient of variation for a dataset.

Using the Merchandise Sales dataset plot a histogram, box and whiskers plot and stem and leaf display.

Perform a one-sample t-test on Merchandise Sales dataset to check if sample mean differs from population mean.

Perform one-way ANOVA to compare means across three groups of the Airline Delays dataset.

Use Poisson distribution to find probability of events occurring in a fixed interval in the Merchandise Sales dataset.

Calculate probabilities using chi-square distribution for Airline Delays dataset.

Perform an F-test to compare variances of two datasets - Merchandise Sales and E-commerce.

Conduct a chi-square test for independence between two categorical variables in the E-commerce dataset.

Create a function to compute the average of a numeric vector and test it. Write an R program using if-else to classify a number as positive, negative, or zero.
